Aura

Version 1.0.0
ecom-addons.com

Aura

Aura is a warm lifestyle theme for the whole shop. A fresh install already looks like a finished store, with demo photos, texts and blocks in English, Spanish and French, and every part of it can be changed visually in the Studio, with a live preview of your real shop.

The home page of a fresh install: photo slider, category tiles, banner mosaic and featured block.

What you get

- **A complete design:** home (photo slider, category tiles, banner mosaic, featured block), header (announcement bar, logo, mega menu with photo panels, one-button or full search, account and cart), category and brand pages, product page, side-drawer mini cart, newsletter card and a dark footer.
- **The Studio:** a full-page visual editor with more than 160 options.
- **Five modules, installed and switched on for you:** Theme Editor (the Studio), Hero Slider Pro, Mega Menu Pro, Content Blocks Pro and Product Reviews Pro. Aura switches off the stock modules they replace: main menu (`ps_mainmenu`), image slider (`ps_imageslider`), featured products, banner, custom text, specials, new products, best sellers, product comments and reassurance.
- **One palette** of five colors (primary, secondary, soft surface, text and background). Every component uses palette colors: the menu, slider buttons, search, header controls, newsletter and buttons.
- **Three languages:** English, Spanish and French.

Requirements

Component	Version
PrestaShop	8.2 · 9.0
PHP	8.1 or later
Overrides	None

Aura is sold as one zip that contains the theme and its five modules. You do not need to buy or install anything else.

Installation

1. Download the zip from **My account › Downloads** on ecom-addons.com. Do not unzip it.
2. In the back office go to **Design › Theme & Logo** and click **Add new theme**, then **Import from your computer** and choose the zip.
3. Click **Use this theme**. PrestaShop installs the five modules and activates them; Aura switches off the stock modules they replace.
4. Open your shop. The demo content is already there.

If you use a multistore, repeat step 3 in each shop that should use Aura.

Your first 10 minutes in the Studio

Open **Modules › Module Manager › Theme Editor › Configure** and click **Open the Studio**.

The Studio: the settings on the left, the live preview of your shop on the right.

The Studio: the settings on the left, the live preview of your shop on the right.

1. **Pick the device** (computer, tablet or phone) at the top of the preview to see how the shop looks on each.
2. **Choose an area:** Header, Page, Footer or Style. The search box finds any setting by name.
3. **Change something.** The preview changes at once. Nothing is public yet: the changes are a draft only you see.
4. **Undo and redo** as many steps as you need.
5. **Save** when you are happy. Texts are edited in the language you choose at the top; the other languages keep theirs.

Change colors, fonts and logo

Colors. In **Style › Colors** you set the palette: main color, secondary, soft surfaces, text and page background. Every component of the theme takes its colors from them, so one change reaches the whole shop. Components that have their own colors (header controls, search, buttons, newsletter, wishlist) let you choose among the palette colors, never a color outside it.

The palette: five colors that every component of the theme uses.

The palette: five colors that every component of the theme uses.

Fonts. In **Style › Typography** choose a font for the text and another for the headings from a list of Google Fonts. The shop downloads the files once and serves them itself, so visitors never contact Google.

Typography: a font for the text, another for the headings, served from your own shop.

Typography: a font for the text, another for the headings, served from your own shop.

Logo. Upload it from the header builder (Header area) and set its maximum height on computer and on phones.

The home page

The home is built with our modules, so you edit each part where it lives:

- **Slider:** Hero Slider Pro, from its own page in the back office. Replace the demo photos and texts, or start from another preset.
- **Category tiles, banner mosaic and featured block:** Content Blocks Pro, from its own page. Each one is a block you can edit, turn off, duplicate or delete.
- **Order of the sections:** in the Studio, drag the home sections to reorder them, or hide the ones you do not want.

The header

The header is a builder. Drag the logo, menu, search, language, currency, account, wishlist, cart and your own buttons between the top bar, the header, a row below, a floating position or hidden. Ready-made header presets give you a starting point: classic, one bar, centered logo and a shop layout with a wide search.

The header builder: drag each block to its place in the top bar, the header or the row below.

- **Search:** size, corners, colors from the palette, how it is sent (Enter key, icon button or text button), collapsed to one round button that opens over its neighbors, and a focus animation.
- **Header controls** share one look: plain, soft or outline, height, corners and icon size.
- **Menu:** edit its content in Mega Menu Pro; its colors and position in the Studio.
- **Announcement bar:** the top bar shows your announcement (one text per language), with its own colors and height.

The header of Aura: announcement bar, logo, menu, search, account and cart.

Category and product pages

A category page: product cards with image, price and add to cart.

Listing: products per row on computer, tablet and phone, card style, image shape and the add to cart button.

Product page (Studio › Page › Product page): a menu with the page structure (five layouts, including three columns, gallery width and side column), photos (slider, block or stack, thumbnails, corners, zoom), buy button (style, color, shadow, corners, quantity, bar fixed at the bottom on phones), wishlist button (position, style, colors), details as accordion, tabs or all open, one look for all sections under the product (lines or cards) and six ready-made product page designs.

The product page: photos, price, buy button and the sections under the product.

The map of the product page. It shows the blocks of the page in four places: the info column, a side column, a full-width row and the sections under the product. Drag a block from one place to another, in the map or inside the live preview. The **Your content** slots are fed by Content Blocks Pro: the map shows the blocks placed in each slot, with a link to edit them or to create one.

The map of the product page: drag blocks between the info column, the side column, a full-width row and the sections.

Reviews come from Product Reviews Pro (stars, photos, verified buyers, moderation and shop replies); see its guide for the settings.

Cart, newsletter and footer

- **Cart:** a dropdown under the icon or a side drawer, three designs, ajax quantities and what the mini cart shows.
- **Newsletter:** five designs and your own texts per language.
- **Footer:** the dark footer and its height; its content areas can be filled with Content Blocks Pro.
- **Spacing:** margins before and after almost every area.

The side-drawer cart with ajax quantities.

The newsletter card and the dark footer.

Export and import a whole design

In **Theme Editor › Export and import the look of the shop**, **Export** downloads one zip with the theme values (all languages), the order of the home sections, which of our modules are on, and the content of the slider, the menu and the blocks with their images and videos. **Import** applies a pack in another shop and replaces what our modules hold. Links to categories, products and pages travel by what they point to, so they are found again in the other shop; a link to something that does not exist there is left empty and reported. Use it to move a shop from QA to production, or to start a new store from a complete design.

FAQ

Do I need the other modules? They are inside the zip and installed with the theme. You do not buy them separately.

What happens to my old menu, slider or reviews? The stock modules are switched off, not deleted. Product Reviews Pro can import the approved comments of PrestaShop's product

comments in one click.

Do visitors contact Google for fonts? No. The fonts are downloaded once by your shop and served from it.

Will it slow the shop down? The options reach the page as one small inline style, with no extra request. The theme is tested against weight budgets (JS, CSS, fonts and requests) that must not exceed those of Hummingbird.

Can I build my own child theme? Yes: Aura is a normal, self-contained theme, and you can create a child of it as with any PrestaShop theme.

Support

Your purchase includes every new version and 6 months of support. Open a ticket from **My account** on ecom-addons.com and tell us your PrestaShop version and what you see; we answer in English, Spanish or French.
