Estimated Delivery Date & Time Slots

Version 1.0.0
ecom-addons.com

Estimated Delivery Date & Time Slots tells your customers when their order should arrive: an **estimated delivery date with a countdown** on product pages, the **estimate of each carrier** in the cart and the checkout, and, for carriers you choose, a **delivery day and time slot** picked by the customer, with a capacity per slot and day. The promise is saved on the order and shown on the order page, in the Orders list, in the customer's account and in the order confirmation email. A printable **delivery sheet** lists what goes out each day.

On the product page: the estimated delivery date and the time left to order for it.

Requirements

Component	Version
PrestaShop	8.2 · 9.0
PHP	8.1 or later
Theme	Classic (tested) or another theme with the `displayProductAdditionalInfo`, `displayShoppingCartFooter`, `displayAfterCarrier` and `displayOrderDetail` hooks
Overrides	None

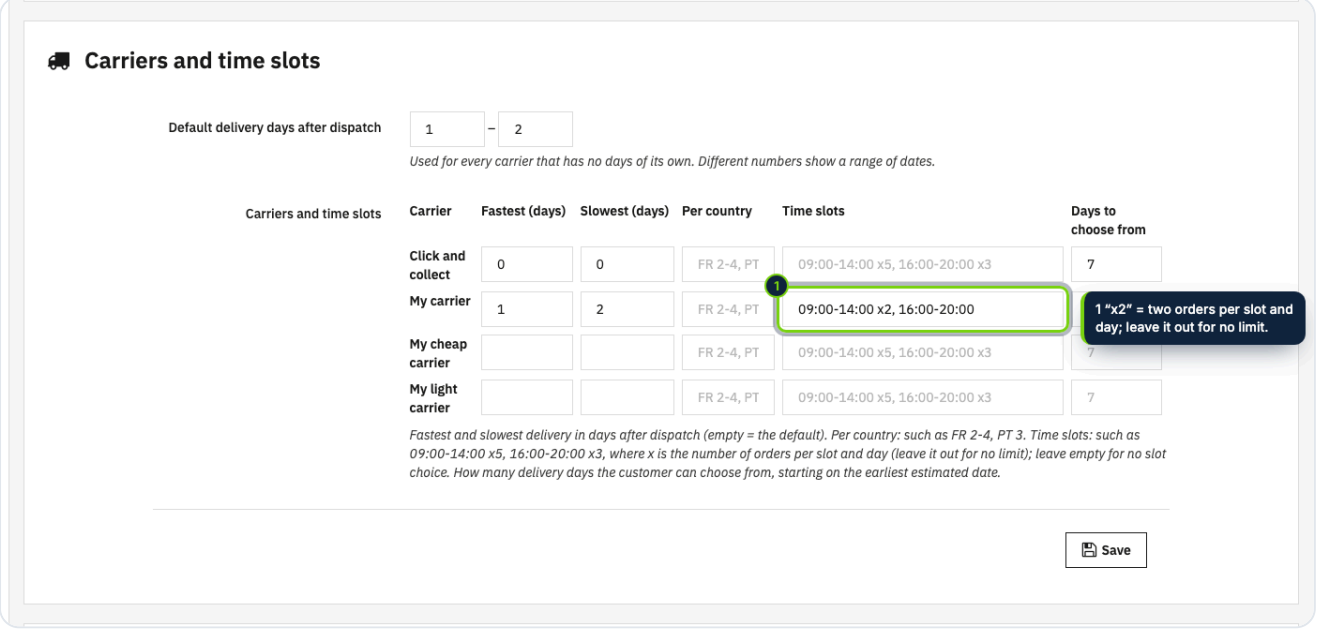

Installation

1. Download the latest version from **My account › Downloads** on ecom-addons.com.
2. In the back office, go to **Modules › Module Manager** and click **Upload a module**.
3. Choose the zip file, then click **Configure**. The module starts with a 14:00 cut-off from Monday to Friday, the national holidays of your shop's country and 2 to 4 delivery days, so dates show at once; adjust them to your shop.

The installation adds **Orders › Delivery sheet** to the back-office menu.

Configuration

The module page has four panels saved together. Times are in the shop's time zone (**International › Localization › Configuration**).

Modules › Configure: delivery days per carrier and country, and time slots with their capacity.

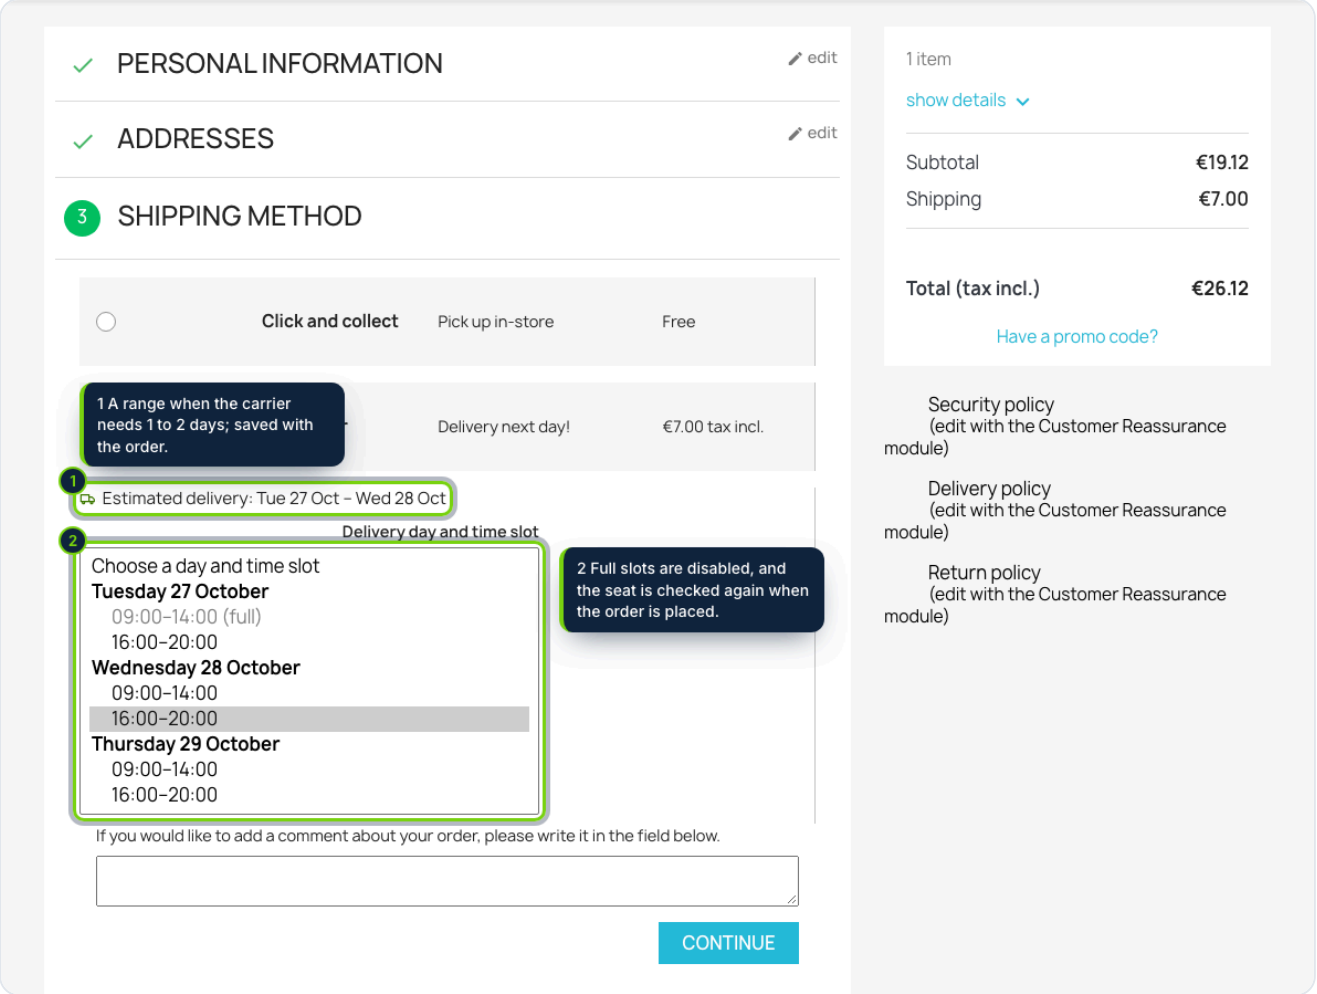

Setting	What it does
Cut-off time per weekday	Orders placed before this time leave the same day (for example `14:00`). Leave a day empty when nothing is dispatched on it (weekends by default).
Preparation days	Shipping days needed before an order leaves (0 = the same day, before the cut-off).
Preparation days per category / per product	Type a few letters of a category name, or of a product name or reference, pick it from the results and set its days; the trash button removes it. A product takes the highest value that applies to it.
Delivery weekdays	Days on which carriers deliver (Monday to Friday by default).
National holidays	The country whose public holidays count: Spain, Portugal, France, Italy, Germany, Belgium, the Netherlands, Austria, Ireland, the United Kingdom (England & Wales), Poland, the United States, Mexico, Argentina or Colombia. They are worked out for every year, Easter included. The holidays of the current year are listed with a tick box: untick the ones you work on.
Closed dates	One date or range per line (`2026-12-24`, `2026-08-01 - 2026-08-15`): no dispatch on those days (regional holidays, holidays of the shop, stocktaking).
Default delivery days after dispatch	Fastest and slowest delivery, used on product pages and for every carrier without days of its own. Different numbers show a range ("Thu 5 Nov – Fri 6 Nov").
Carriers and time slots	Per carrier: fastest and slowest days (empty = default), days per country (`FR 2-4, PT 3`), time slots with their capacity (`09:00-14:00 x5, 16:00-20:00 x3`: x is the number of orders per slot and day; without x there is no limit) and how many delivery days the customer can choose from (7 by default).
Where it shows	Product pages, cart and checkout.
Products out of stock	Show a text of their own (per language; empty = our default text) or nothing.
Customers can change the slot until	Hours before the slot starts (24 by default; 0 = no changes from the account).
Delete the delivery dates when uninstalling	Off by default: the promises saved on orders stay.

How it works in the shop

- **Product page**: "Estimated delivery: tomorrow" or "Estimated delivery: Thu 5 Nov – Fri 6 Nov", and "Order within 3 h 12 min to get this date" until the cut-off. The page is the same for every

visitor: the date and the countdown are worked out in the browser, at the shop's time, from the rules the page carries, so full-page caches stay right. When the cut-off passes, the date moves to the next shipping day without a reload. The block follows the combination chosen (its stock) and uses the preparation days of the product and its categories.

- **Cart**: the estimate of the selected carrier (or the default one) under the cart lines.
- **Checkout, shipping step**: under each carrier, its estimate for the delivery address's country. A carrier with time slots shows a list grouped by day; full slots and slots that have already started are disabled.

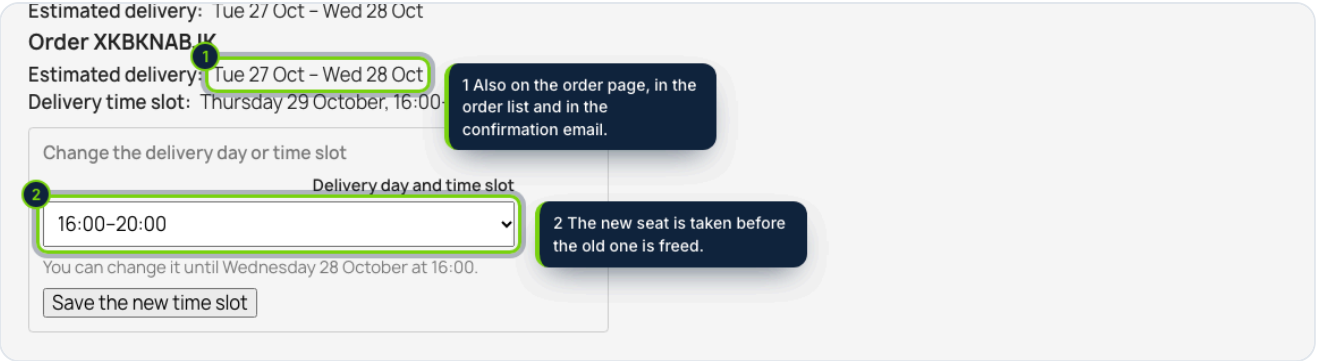

In the checkout: the estimate under each carrier and, for your own delivery, the day and time slot.

When the customer clicks **Continue**, the module checks the slot again on the server (a forged or outdated choice is refused) and holds a seat for the cart for 60 minutes. When the order is placed the seat becomes the order's. Every seat is a numbered row under a database key, so two customers ordering at the same moment can never get more seats than the slot has. If the hold expired and the slot filled up in the meantime, the order keeps the slot and the order page warns you to agree another one.

Out-of-stock products sold on backorder show the out-of-stock text (or nothing) instead of a date, and carts that contain one get no time slot.

Customer account

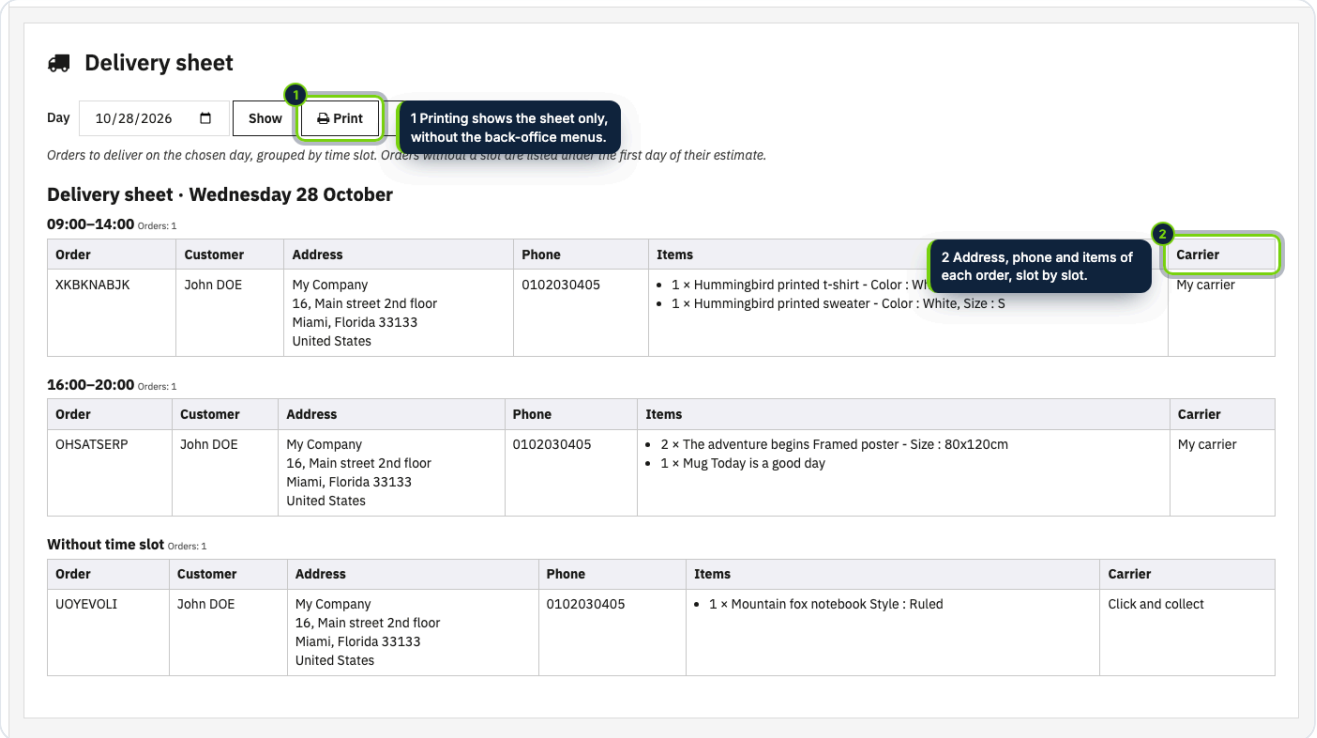

“My deliveries” in the customer account: the estimate, the slot, and a change until the deadline you set.

My account › My deliveries and the order details page show the estimate and the slot. Until the deadline (24 hours before the slot by default) the customer can choose another day or slot; the new seat is taken before the old one is freed, and the form is protected by the customer's token.

Back office

- **Order page**: an "Estimated delivery" panel in the side column with the estimate, the slot and the carrier.
- **Orders list**: a "Delivery" column with the slot (or the estimated dates).
- **Order confirmation email**: the estimate and the slot are added under the carrier line of PrestaShop's own `order_conf` email.
- **Orders › Delivery sheet**: choose a day to see its orders grouped by time slot, with the delivery address, phone and items. Orders without a slot appear on the first day of their estimate. **Print** prints the sheet only; **Download CSV** gives the same rows for a spreadsheet.

Orders › Delivery sheet: the orders of a day grouped by time slot, ready to print or download as CSV.

Cancelled, refunded and failed orders free their seat and are left out of the sheet.

Styling

The blocks use your theme's fonts and colours. Override `--ecom-dd-accent` (icon and border) and `--ecom-dd-bg` (background) on `.ecom-dd` in your theme's CSS, or the classes `.ecom-dd-estimate`, `.ecom-dd-slots` and `.ecom-dd-summary`.

Languages

English, Spanish and French are included for the shop and the module page. Dates are written in the customer's language ("jueves 5 de noviembre", "jeudi 5 novembre"). Other languages can be translated in **International › Translations** (module `ecomaddonsdeliverydate`).

Data and privacy

The module stores the estimate and the slot of each order and the seats of the slots in its own tables. It adds no personal data: the delivery sheet reads the order's address. Uninstalling removes the settings, the seats and the unfinished checkouts; the order dates stay unless you tick "Delete the delivery dates...".

Every date is an **estimate** based on your rules; the module makes no promise on behalf of carriers.

Updates and support

New versions are free for life from **My account › Downloads**; upload the new zip in **Module Manager** to update. Support is included for 6 months from the purchase.
